

Portfolio Website - <https://gcookiez.github.io/showcase/>

Main Learning Points

- Utilization more of GSAP to add some animations
- An eye-catching webpage to give attention to some of my work.
- Should showcase confidence in their own work, regardless of delivery.
- Components are coded in Typescript but not in React
- Eventually, the site will be utilized for anyone to contact the dev personally (module to be done in GitHub Actions)
- Blog (on the next page) might not be intended for anyone professional in a glance.

Current Pet Project - <https://crispypata.neocities.org/>

Main Learning Points

- Applied One Page Website Rendering Technique. Only one HTML file is used to render the page. The rest is handled by the JS shell developed.
- Learned to pre-render some document by only serving JSON files and the shell will render the necessary assets.
- Manually Added some animations on some elements.
- Learned how to manipulate some of the SEO tools. Though changes are visible when searching this webpage, more work needs to be done.
- Learned how to be efficient with some images by applying reusability , especially the system icons and the burger animation

Mock Terminal - <https://gcookiez.github.io/main-portfolio/>

```
marcus@main-portfolio>
```

```
Available Commands
```

```
linkedin -- Displays user profile from linkedin
```

```
github -- Displays user profile from github
```

```
indeed -- Displays user profile from Indeed (Currently Unavailable)
```

```
portfolio -- Displays link for developer's resume
```

```
help -- Displays this exact page
```

```
clear -- Clears screen
```

```
profile <[user | env]> <name> -- Changes name or env shown post execution
```

```
animate <[shake | fly]> -- Animates Terminal Window
```

```
weather -- Displays current weather (only accurate to client's ISP source)
```

```
datetime -- Displays current datetime from JavaScript Runtime
```

```
version -- Displays version number
```

```
ascii -- Displays ascii art (experimental)
```

```
$ > █
```

- Experimenting the capabilities of React as a means of Web Development
- Wanted to create a terminal style webpage as a means of navigation
- Experimenting the GSAP library to showcase some of the animations added in the terminal. An error shakes the whole terminal
- Used React to assemble

Perti Solutions - Intern

- Tasked to create the mockup for the company's page
- Tasked to apply changes of the page in WordPress using Elementor

Globiq Brower Agent – currently unlisted

- A chrome extension that assists with communication between bookkeepers from different companies.
- Works on Exact, Zenvoices. Minimal Support on other bookkeeping software.
- A popout button and a floating iframe are used to display the service.
- Pick up data from the parent webpage and serve as added details for the intended topic.
- Timed Push notifications are supported.
- Back-end was mostly handled through iframe initially and transitioned to REST Api to comply with the Chrome Extension Coding standards.

Globiq Assistant – Currently Unlisted

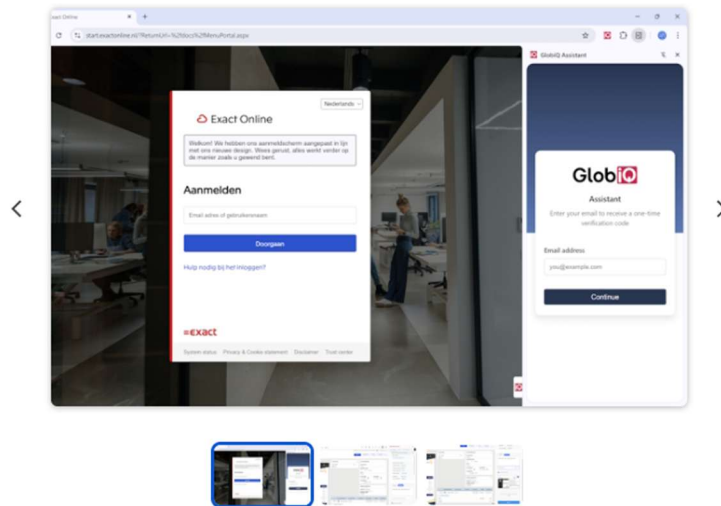

Add to Chrome

Share

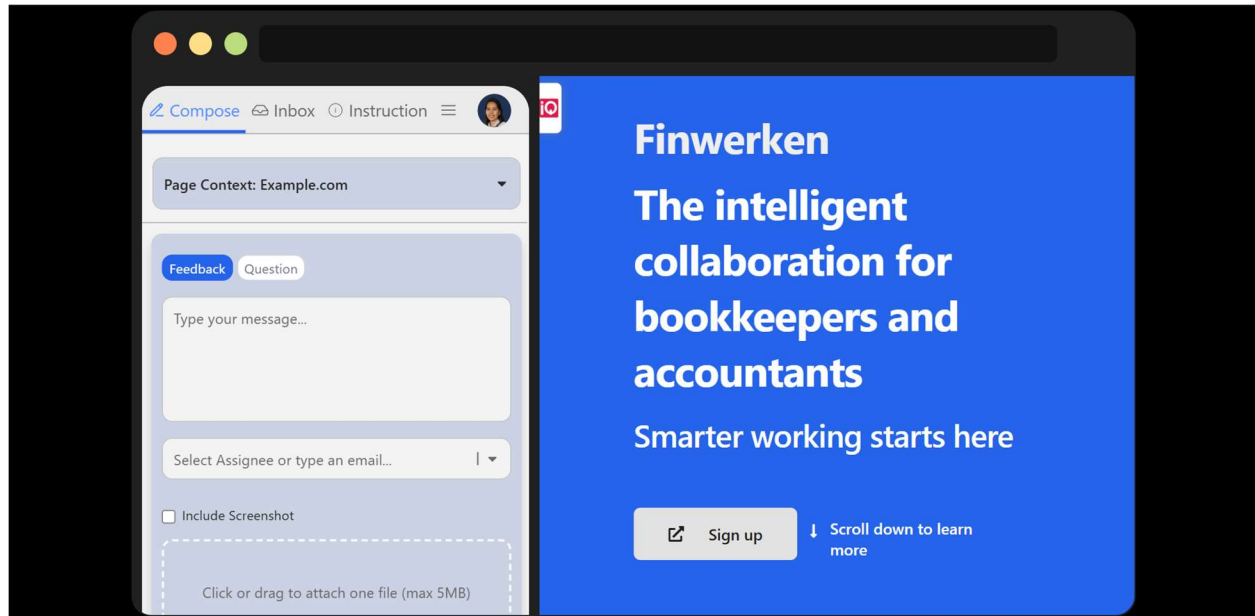

Extension

Workflow & Planning

- Worked on modifying the Login and OTP for the side panel.
- Extension is like previously mentioned extension except using a side panel for the interface
- Front-end technology using React and Minified and compiled from Vite.
- The prototype of the code base was AI-assisted to speed up production and cleaned up manually for maintainability.

Finwerken.nl – Currently Displaying Previous version

- Developed using Vite for compilation and minifying, VanillaJS for the rendering, Squarespace for hosting, and GSAP for animations
- The intention was to create an eyecatching webpage to showcase the new Globiq Assistant.
